MAKE THE RIGHT CHOICE & IMPROVE YOUR VISION

Having choices is important to our independence. This is especially true with cataract surgery and lens implants. Cataract surgery is an opportunity to achieve independence from glasses or contacts. Dr. Rom will replace the defective lens that causes blurring and light distortions with a new lens. You have a choice between a clear lens or a variety of state-of-the-art lenses that can improve your vision. The chart below outlines how the various procedures impact vision, whether or not glasses are needed, what insurance covers, and costs.

INSIGHT EYE CENTER CHOICES	WILL I NEED GLASSES?	COVERED BY INSURANCE	YOUR COST PER EYE
Standard	Yes	Yes	+Co-pay
Enhanced	Reading glasses	No *	Varies depending on lens type
Advanced Technology	No **	No *	Varies depending on lens type

**Only the basic cataract surgery is covered. **Glasses will not be needed for the majority of lifestyle activities but there are exceptions.*

CATARACT LENSES & ADVANCED TECHNOLOGY

Traditional cataract surgery uses a monofocal lens which improves near vision, or distance vision, but usually not both. Advanced technology in the area of implant lenses makes it possible to improve both distance and close vision, and sometimes the vision of distances in between in addition to correcting astigmatism or unusually shaped corneas.

Cataract surgery is one of the most commonly performed surgical procedures in the U.S. Many patients who qualify for traditional cataract surgery will also qualify for the procedure with the newer lenses. Cataract surgery is generally a 15 minute outpatient procedure regardless of the type of lens.

Dr. Rom and the staff at Insight Eye Center are available to help you. Call our offices to find out more about how to improve your vision through cataract surgery.
